

F-Secure Anti-Virus for Citrix Servers

Citrix MetaFrame solutions enable businesses to improve their productivity by providing easy access to information and applications regardless of time, place and access device(s). Because worms and viruses can cause severe disruptions in business continuity and productivity, it is important to minimize the risk of server downtime by using real-time antivirus protection that is updated automatically, frequently, and fast when new virus epidemics arise. F-Secure® Anti-Virus™ for Citrix Servers works automatically and transparently updating virus definitions multiple times a day to stay ahead of the fast-spreading virus outbreaks.

Automatic Real-Time Antivirus Protection

F-Secure Anti-Virus for Citrix Servers is installed on Citrix MetaFrame Presentation Servers or Microsoft Terminal Servers. The software scans files that are read and stored on the Citrix or Microsoft Terminal Server. F-Secure Anti-Virus for Citrix Servers provides comprehensive protection for server-based sessions. All files that are accessed through the server-based session are scanned for viruses, including the files that are stored through the session locally on the remote workstation or laptop. The software updates virus definition databases automatically and securely. Definition files are downloaded in the background using bandwidth that is not being used by other Internet applications. The system administrator can always be sure that they have the latest antivirus updates without having to search on the web.

Improved Performance and Manageability

F-Secure Anti-Virus for Citrix Servers caches file indexes. As a result, only the changed files are scanned, which improves the server performance. The scanning is done in a single process allowing the IT administrator to change and monitor the process priority. Only the network administrator can access the F-Secure Anti-Virus for Citrix Server settings over a server-based session, preventing users with normal access rights from bypassing the security settings. With the administrator rights to the server, the network administrator can install F-Secure Anti-Virus for Citrix Servers over a server-based session. The management of F-Secure Anti-Virus for Citrix Servers is done centrally using F-Secure Policy Manager.

Key Features

Real-Time Automatic Protection

Remote connections, viruses, worms, and Trojans attacking through network are stopped in real-time.

Improved Performance

Because file indexes are cached, only the changed files are scanned to improve server performance.

Single Process Scanning

The scanning is done in a single process allowing IT administrator to change and monitor the process priority.

Multiple Scanning Engines

F-Secure Anti-Virus for Citrix Servers uses multiple scanning engines to improve detection rate and stability.

Central Management

The software can be remotely installed, configured and monitored from one central location.

Lock Down of Security Settings

The network administrator can lock down the security settings to prevent the users without administrator rights from bypassing security settings.

Support for Microsoft Terminal Server

F-Secure Anti-Virus for Citrix Servers supports Microsoft Terminal Servers and provides them the same degree of protection and features as for Citrix MetaFrame Servers.

Flexible Licensing

F-Secure Anti-Virus for Citrix Servers licensing is based on the users having access to the servers. The licensing does not limit the number of server installations for server farms, but allows the administrator to add more servers to increase the computing power without having to increase the license size.

Centralized Management

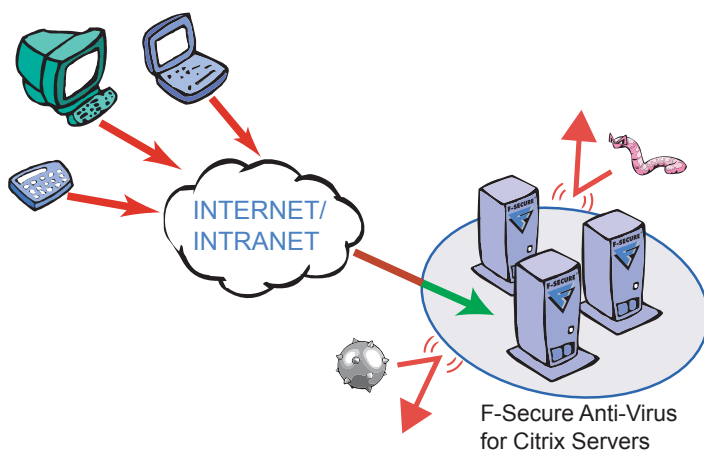

With F-Secure Policy Manager the network administrator can remotely install, deploy, configure and monitor F-Secure Anti-Virus for Citrix Servers from one central location. The administrator can automatically and remotely install, configure and update the applications. It is possible to manage the security applications on almost any device and across the enterprise so that even the security of mobile workers' laptops is guaranteed.

Automatic Reports

F-Secure Policy Manager provides comprehensive reports on virus statistics and network status for entire fleet of Citrix Servers enabling the system administrator to stay constantly updated on what is happening in the corporate network.

World's Leading Virus Research

Antivirus products are only as good as the research and dedication that are behind them. Our team of dedicated virus researchers is on call 24-hours a day responding to new and emerging threats. In fact, F-Secure is one of the only companies to release tested daily virus definition updates to make sure our customers are receiving the highest quality service and protection.
