

POLICY MANAGER

F-Secure® Policy Manager™ offers an easy and scalable way to deploy security applications, define and deploy security policies, and monitor security to ensure compliance with corporate security policies. With F-Secure Policy Manager, corporate IT administrators can centrally manage antivirus solutions as well as all critical network and content security solutions on all tiers of the network.

Centralized Policy-Based Management

F-Secure Policy Manager is a distribution and management tool for administrators. It makes sure security policies keep users protected at all times, regardless of time and place.

Ease-of-Use and Deployment

F-Secure Policy Manager is up and running in minutes thanks to its high performance and intuitive graphical user interface. There is no need to physically visit remote systems to install, update or configure security software. Everything is done from one central location. When installing F-Secure Client Security™, other antivirus software can be remotely detected and automatically removed. Antivirus and security management is easier than ever!

Single Management for Multiple Defenses

Using F-Secure Policy Manager, IT administrators can remotely manage antivirus, antispysware, antirootkit, behaviour-monitoring, desktop firewall, intrusion prevention, application control, browsing protection and quarantine on workstations and laptops.

Using the same console, administrators can also manage antispam, antivirus and content filtering on servers and gateways, minimizing the cost and complexity of a multi-vendor solution.

Support for Microsoft Windows Installer (MSI)

IT administrators can export Microsoft Windows Installer (MSI) packages from the F-Secure Policy Manager Console. The installation packages can be used with third party software deployment tools.

Key Features

Centralized Management

Installs, configures, updates, upgrades, manages and monitors the security applications from one location.

Low Total Cost of Ownership

Eliminates the costs and hassle associated with manual installations. Furthermore, no additional hardware and software, such as databases or web servers, are needed.

Scalable Management

Often a single management server is enough to scale with your business. Very large environments can be managed by adding multiple Policy Manager Servers.

Fast Policy Management

Changes and distributes security policies to the entire organization in minutes, which ensures fast reaction times to emerging security threats.

Lock-Down of Client Settings

Locks down security settings on workstations, preventing end-users from disabling protection.

Extensive Graphical Reporting

Easily generates extensive reports on security alerts and network status. Graphical, pre-defined reports are also available with F-Secure Policy Manager Web Reporting.

Easy Adding of Clients

IT administrators can create rules for automatically adding new hosts into the security domain hierarchy without the need to manually import individual computers.

F-Secure Policy Manager Console

Corporate security managers set up corporate policies in the F-Secure Policy Manager Console. IT administrators then deploy and distribute all policy, configuration and installation files to F-Secure Policy Manager Server. IT administrators also receive alarms and alerts when security breaches are attempted but blocked.

F-Secure Policy Manager Server

The F-Secure Policy Manager server forces the hosts to download all new applications, upgrades and updates according to the security policies. Downloads are automatically unpacked and installed in the host computer, based on policies and configuration information. All this is done automatically and transparently in real time.

F-Secure Policy Manager Web Reporting

The detailed graphical reports in F-Secure Policy Manager Web Reporting allow administrators to identify computers that are unprotected or vulnerable to virus outbreaks before they actually occur. F-Secure Policy Manager Web Reporting provides over 40 pre-defined graphical reports, making it very quick and easy to locate unprotected computers, track virus outbreaks, validate security settings and present the current security status in a visual format.

F-Secure Policy Manager Proxy

F-Secure Policy Manager Proxy is designed to deliver daily virus definition database updates to remote offices over slow WAN connections. The updates are transferred only once over the slow network link and distributed locally to workstations and servers in the remote offices, which significantly reduces the traffic used for downloading the daily updates over the Internet.
